1. **INTRODUCTION**

This Guideline introduces the process of developing S-100 Product Specifications. It is not intended to enable those unfamiliar with S-100 to develop Product Specifications, as that requires specialist knowledge of data modelling. The Guideline draws on Appendix A of IHO S-100, but reference should be made to that document for a more detailed description of the process.

2. **BACKGROUND**

S-100 is a Geographic Information System (GIS) standard developed by the International Hydrographic Organization (IHO). It provides a framework for the creation of Product Specifications and Software. S-100 has been based on the widely used ISO 19100 series of GIS standards.

S-100 has been developed to provide a contemporary standard on which IHO product specifications can be built and aligned with mainstream GIS. S-100 is now being used more widely within the maritime domain, specifically as the baseline for the data structure of e-navigation. It has been recognised that S-100 can be used beyond solely geospatial data.

3. **SCOPE**

A Product Specification is a technical description of a data product or service. It includes general information for data identification as well as information on data content and structure, reference systems, data quality aspects, data capture, maintenance, delivery and metadata.

4. **INFORMATION REQUIRED**

The information needed by the data-modelling specialist to develop a Product Specification is the functional requirement for the application – what it is meant to do. This needs to be set out in sufficient detail to build a model. For example, a Product Specification is being developed for AtoN Information, derived from a spreadsheet developed by AMSA in conjunction with the Australian Hydrographic Office. This spreadsheet contained the information requirements from which to develop the model that forms the core of the Product Specification.

5. **PRODUCT SPECIFICATION PROCESS**

The diagram below, taken from ISO 19109, illustrates the process of converting a real situation into a geographic data model:

The flow diagram in Figure 2 is based on S-100 Appendix A and shows the process for a geospatial product, which could include vector and coverage data.
**Figure 2  Product specification process**

- **Determine geometry requirement**
  - **Vector or Coverage?**
    - **Vector**
    - **Coverage**
      - **Determine feature classes**
        - **Definition s exist?**
          - **Yes**
            - **Determine attributes**
              - **Definition s exist?**
                - **Yes**
                  - **Determine enumerants**
                    - **Definition s exist?**
                      - **Yes**
                        - **Bind features and attributes**
                          - Register definitions in the GI Registry
                            See section 6
                          - Feature Catalogue
                            Defines content
                          - Portrayal Catalogue
                            Defines display
                          - Dataset
                            Specified in Metadata
          - **No**
            - **Determine geometry types**
              - **Types**
                - **No**
                  - **Apply to TSMAD for Addition**
                    - **Yes**
                      - **Create application schema**
                        - **Create Feature Catalogue**
                          - **Coordinate Reference System**
                            - **Product Specification Documentation**
                              - **END**
                          - **Build Portrayal Catalogue**
                            - **Feature Catalogue**
                              - **Content and structure of coverage**

**ILA Guideline 1088 – Introduction to Preparing S-100 Product Specifications**
Edition 1.0  December 2012
6. **KEY STEPS**

The following are key steps when developing S-100 based product specifications:

6.1. **DETERMINE GEOMETRY REQUIREMENT**

The first step in developing the specification is to determine whether the data will be discrete or continuous (vector geometry or coverage-based see 6.1.1). A product specification may include both discrete and continuous data and these can be scoped separately.

6.1.1. **VECTOR GEOMETRY OR COVERAGE-BASED**

Geographic phenomena fall into two broad categories — discrete and continuous. Discrete phenomena are recognizable objects that have relatively well-defined boundaries or spatial extent. Examples could include buildings, or aids to navigation. Continuous phenomena vary over space and have no specific extent. Examples could include radio signal strength or ground elevation. A value or description of a continuous phenomenon is only meaningful at a particular position in space (and possibly time). Signal strength, for example, takes on specific values only at defined locations, whether measured or interpolated from other locations.

6.2. **DETERMINE CLASSES AND ATTRIBUTES**

The next step is to identify groups or classes into which the data objects fall and their associated properties or attributes. The data objects, classes and attributes may have already been defined for another application and those existing definitions should be used. If not, then new definitions will need to be created. S-100 uses two specific object types, the feature type for objects that have attributes and geometric properties and the information type which is an object with no geometric properties. Information types can be associated to feature types.

6.2.1. **EXAMPLE**

Aids to Navigation are discrete phenomena, which can be divided into the classes: fixed and floating. As they carry a position these would be feature types in S-100. Their properties would be defined as attributes, such as shape, colour and name.

An AtoN Report could be an information type carrying details of the report, date and the author.

Note: Attributes other than geometric properties are considered thematic attributes these can be simple or complex. A simple attribute carries a descriptive characteristic usually a value of a given type e.g. text, date, Boolean, integer. A complex attribute is a property composed of one or more simple attributes known as sub attributes.

6.3. **CREATE APPLICATION SCHEMA**

The next step is to create a model (schema) of the application. This can either be a logical model or a physical model.

**EXAMPLE**

A logical (conceptual) model can be created in Unified Modelling Language (UML). A physical (encoded) model can be created in Extensible Markup Language (XML).
If the application involves complex structures or relationships, these can more easily be visualised in UML and the resulting logical model should be included in the Product Specification. In some cases, it is possible to generate the physical model automatically from the logical model.

In S-100 application schemas are realised in a Feature Catalogue, which is encoded in XML. This defines the features, information types and attributes used within a data product.

### 6.4. CO-ORDINATE REFERENCE SYSTEM

The appropriate Co-ordinate Reference System (CRS) must be determined for the data product.

**EXAMPLE**

WGS84 (World Geodetic System of 1984) should be used for the horizontal reference system for spatial data. WGS84 should be used as the reference ellipsoid. Any conversion must be undertaken by the data producer.

### 6.5. UNITS

Measurement units need to be specified.

**EXAMPLE**

metres, nautical miles.

### 6.6. DATA QUALITY

Accuracy of data and validation procedures should be indicated.

**EXAMPLE**

$\pm$ 1 m (95% probability) measured against a given reference system.

### 6.7. MAINTENANCE

The ownership of the specification and the revision arrangements should be shown.

**EXAMPLE**

IALA Committee XYZ is responsible for revising this Product Specification annually.
6.8. PORTRAYAL

Portrayal is optional in S-100, but if included, provides the rules for display and symbology, which apply to the data defined in this specification and should be described in a Portrayal Catalogue.

6.8.1. EXAMPLE

Display and symbols should be in accordance with IMO SN Circ. 243.

Data format (encoding)

Encoding needs to be discussed; options include XML and GML (Geography Markup Language).

For some products a web service such as an OGC Web Feature Service (WFS) may replace traditional encoding formats.

The following example shows an XML encoding for buoys, taken from a model produced by the General Lighthouse Authorities, put in a form of XML being developed by the UK Hydrographic Office for S-100 Product Specifications.

```xml
<?xml version="1.0" encoding="utf-8" ?>
<s100:FeatureCollection xmlns:s100="http://www.iho.int/S-100" xmlns:a104="http://www.iala-aism.org/A-104"
    xsi:schemaLocation="http://www.iala-aism.org/A-104 A-104XMLSchema.xsd">
    <s100:featureMember>
        <a104:BuoySpecialPurposeGeneral s100:id="F1">
            <a104:featureName>AFAN OUTFALL INNER</a104:featureName>
            <a104:buoyShape>spherical</a104:buoyShape>
            <a104:categoryOfSpecialPurposeMark>pipeline mark</a104:categoryOfSpecialPurposeMark>
            <a104:colour>yellow</a104:colour>
            <a104:depth>8.1</a104:depth>
            <a104:topmark>
                <a104:topmarkShape>x‐shape (St. Andrew's cross)</a104:topmarkShape>
                <a104:topmarkColour>yellow</a104:topmarkColour>
            </a104:topmark>
            <s100:Point><s100:pos>‐3.90093 51.58994</s100:pos></s100:Point>
        </a104:BuoySpecialPurposeGeneral>
    </s100:featureMember>
    <s100:featureMember>
        <a104:Lights s100:id="F2">
            <a104:signalPeriod>10</a104:signalPeriod>
            <a104:signalGroup>(1)</a104:signalGroup>
            <a104:colour>yellow</a104:colour>
            <a104:lightCharacteristic>flashing</a104:lightCharacteristic>
            <a104:lightDescription>Fl.Y.10s</a104:lightDescription>
            <s100:Point><s100:pos>‐3.90093 51.58994</s100:pos></s100:Point>
        </a104:Lights>
    </s100:featureMember>
</s100:FeatureCollection>
```

7. USING THE IHO S-100 GI REGISTRY

The S-100 Registry is built on the foundations of ISO 19135 and it provides a series of registers that can be considered dictionaries of items used within S-100 Product Specifications. The process begins with the preparation and agreement of a submission resulting from the development of a data model and that is the part of the process addressed by this Guide.

8. SUBMISSIONS

Submissions of items from IALA Members will normally be made by the IALA Domains Management, which will advise on the process and procedures.

9. ACRONYMS

AMSA Australian Maritime Safety Authority
AtoN Aid(s) to Navigation
Circ. Circular (IMO)
CRS Co-ordinate Reference System
GIS Geographic Information System
GLA General Lighthouse Authority(ies)
GML Geography Markup Language
IALA International Association of Marine Aids to Navigation and Lighthouse Authorities
IHO International Hydrographic Organization
IMO International Maritime Organization
ISO International Organization for Standardization
m metre
OGC Open Geospatial Consortium
R&RNAV Radio & Radionavigation Committee (IALA)
SN Safety of Navigation (IMO)
S-100 Geospatial Information Registry (IHO)
UK United Kingdom
UKHO UK Hydrographic Office
UML Unified Modelling Language
WFS Web Feature Service
WGS84 World Geodetic System (1984) (Reference coordinate system used by GPS)
XML Extensible Markup Language
